## PROJECTS

- **Air Quality Detection Using Land Coverage.**

Air pollution is the one of most dangerous problem in world, as it badly effects on human health, animal health and environment system. Air pollution is one of the largest environmental health risks in India today. Quality of the air in all areas is the most important factor that directly influences the incidence of diseases and decreases the quality of life. Taking appropriate decisions in a timely period depends on the measurement and analysis of the parameters of the air, which creates the need for the development of real time air quality detection. The use of colored pictures of earth surface makes it possible to do a detailed level analysis of major pollutants and their sources. These detection systems are important components in many particular area projects for detecting air quality and for controlling the main pollutant concentrations in specific areas. In this project we present an approach for cost-effective measurement of relevant environmental parameters, based on a Land coverage analysis. These applications used for test local environmental air quality.
